14.4: Hamiltonian Mechanics Examples

I’ll do two examples by hamiltonian methods – the simple harmonic oscillator and the soap slithering in a conical basin. Both are conservative systems, and we can write the hamiltonian as \( H = T + V \), but we need to remember that we are regarding the hamiltonian as a function of the generalized coordinates and momenta. Thus we shall generally write translational kinetic energy as \( \frac{p^2}{2m} \) rather than as \( \frac{1}{2}m\nu^2 \), and rotational kinetic energy as \( \frac{L^2}{2I} \) rather than as \( \frac{1}{2}I\omega^2 \).

**Simple harmonic oscillator**

The potential energy is \( \frac{1}{2}kx^2 \), so the hamiltonian is

\[
H = \frac{p^2}{2m} + \frac{1}{2}kx^2.
\]

From equation D, we find that \( \dot{x} = \frac{p}{m} \), from which, by differentiation with respect to the time, \( \ddot{x} = -kx \). Hence we obtain the equation of motion \( m\ddot{x} = -kx \).

**Conical basin**

We refer to Section 13.6:

\[
T = \frac{1}{2}m(\dot{r}^2 + r^2 \sin^2 \alpha \dot{\phi}^2 + \alpha \dot{\phi}^2) + mgr \cos \alpha
\]

UC Davis ChemWiki is licensed under a Creative Commons Attribution-Noncommercial-Share Alike 3.0 United States License.
\[
L = \frac{1}{2} m (\dot{r}^2 + r^2 \sin^2 \alpha \dot{\phi}^2) - mg r \cos \alpha
\]

\[
L = \frac{1}{2} m (\dot{r}^2 + r^2 \sin^2 \alpha \dot{\phi}^2) + mg r \cos \alpha
\]

But, in the Hamiltonian formulation, we have to write the Hamiltonian in terms of the generalized momenta, and we need to know what they are. We can get them from the Lagrangian and equation \( A \) applied to each coordinate in turn. Thus

\[
P_r = \frac{\partial L}{\partial \dot{r}} = m \dot{r} \quad \text{(Label 14.4.1)}
\]

and

\[
P_\phi = \frac{\partial L}{\partial \dot{\phi}} = mr^2 \sin^2 \alpha \dot{\phi}. \quad \text{(Label 14.4.2)}
\]

Thus the Hamiltonian is

\[
H = \frac{P_r^2}{2m} + \frac{p_\phi^2}{2mr^2 \sin^2 \alpha} + mg r \cos \alpha. \quad \text{(Label 14.4.3)}
\]

Now we can obtain the equations of motion by applying equation \( D \) in turn to \( \dot{r} \) and \( \dot{\phi} \) and then equation \( C \) in turn to \( \dot{r} \) and \( \dot{\phi} \):

\[
\dot{r} = \frac{\partial H}{\partial p_r} = \frac{p_r}{m}, \quad \text{(Label 14.4.4)}
\]

\[
\dot{\phi} = \frac{\partial H}{\partial p_\phi} = \frac{p_\phi}{mr^2 \sin^2 \alpha}, \quad \text{(Label 14.4.5)}
\]

\[
\dot{p}_r = -\frac{\partial H}{\partial r} = \frac{p_\phi^2}{mr^3 \sin^2 \alpha} - mg \cos \alpha, \quad \text{(Label 14.4.6)}
\]

\[
\dot{p}_\phi = \frac{\partial H}{\partial \phi} = 0. \quad \text{(Label 14.4.7)}
\]

Equations \( \text{(Label 14.4.2)} \) and \( \text{(Label 14.4.7)} \) tell us that \( mr^2 \sin^2 \alpha \dot{\phi} \) is constant and therefore that

\[
r^2 \dot{\phi} \quad \text{is constant,} = h, \quad \text{(Label 14.4.8)}
\]

This is one of the equations that we arrived at from the Lagrangian formulation, and it expresses constancy of angular momentum.

By differentiation of Equation \( \text{(Label 14.4.1)} \) with respect to time, we see that the left hand side of Equation \( \text{(Label 14.4.6)} \) is \( m \ddot{r} \). On the right hand side of Equation \( \text{(Label 14.4.6)} \), we have \( p_\phi \), which is constant and equal to \( mh \sin^2 \alpha \). Equation \( \text{(Label 14.4.6)} \) therefore becomes

\[
\ddot{r} = \frac{h^2 \sin^2 \alpha}{r^3} - g \cos \alpha, \quad \text{(Label 14.4.9)}
\]

which we also derived from the Lagrangian formulation.
